OPEN ACCESS 

### RESEARCH ARTICLE

## Masitinib as an add-on therapy to riluzole in patients with amyotrophic lateral sclerosis: a randomized clinical trial

### Abstract

**Objective:** To assess masitinib in the treatment of ALS. **Methods:** Double-blind study, randomly assigning 394 patients (1:1:1) to receive riluzole (100 mg/d) plus placebo or masitinib at 4.5 or 3.0 mg/kg/d. Following a blinded transition from phase 2 to phase 2/3, a prospectively defined two-tiered design was implemented based on ALSFRS-R progression rate from disease-onset to baseline ( $\Delta$ FS). This approach selects a more homogeneous primary efficacy population (“Normal Progressors”,  $\Delta$ FS < 1.1 points/month) while concurrently permitting secondary assessment of the broader population. Primary endpoint was decline in ALSFRS-R at week-48 ( $\Delta$ ALSFRS-R), with the high-dose “Normal Progressor” cohort being the prospectively declared primary efficacy population. Missing data were imputed *via* last observation carried forward (LOCF) methodology with sensitivity analyses performed to test robustness. **Results:** For the primary efficacy population, masitinib ( $n=99$ ) showed significant benefit over placebo ( $n=102$ ) with a  $\Delta$ ALSFRS-R between-group difference ( $\Delta$ LSM) of 3.4 (95% CI 0.65–6.13;  $p=0.016$ ), corresponding to a 27% slowing in rate of functional decline (LOCF methodology). Sensitivity analyses were all convergent, including the conservative multiple imputation technique of FCS-REGPMM with a  $\Delta$ LSM of 3.4 (95% CI 0.53–6.33;  $p=0.020$ ). Secondary endpoints (ALSAQ-40, FVC, and time-to-event analysis) were also significant. Conversely, no significant treatment-effect according to  $\Delta$ ALSFRS-R was seen for the broader “Normal and Fast Progressor” masitinib 4.5 mg/kg/d cohort, or either of the low-dose (masitinib 3.0 mg/kg/d) cohorts. Rates of treatment-emergent adverse events (AEs) (regardless of causality or post-onset  $\Delta$ FS) were 88% with masitinib 4.5 mg/kg/d, 85% with 3.0 mg/kg/d, and 79% with placebo. Likewise, rates of serious AE were 31, 23, and 18%, respectively. No distinct event contributed to the higher rate observed for masitinib and no deaths were related to masitinib. **Conclusions:** Results show that masitinib at 4.5 mg/kg/d can benefit patients with ALS. A confirmatory phase 3 study will be initiated to substantiate these data.

**Keywords:** Clinical trials, therapy, tyrosine kinase inhibitor, masitinib

## Long-term survival analysis of masitinib in amyotrophic lateral sclerosis

Jesus S. Mora, Walter G. Bradley, Delia Chaverri, María Hernández-Barral, Javier Mascias, Josep Gamez , Gisella M. Gargiulo-Monachelli, Alain Moussy, Colin D. Mansfield , Olivier Hermine and Albert C. Ludolph

### Abstract

**Background:** A randomized, placebo-controlled phase III study (AB10015) previously demonstrated that orally administered masitinib (4.5 mg/kg/day) slowed rate of functional decline, with acceptable safety, in amyotrophic lateral sclerosis (ALS) patients having an ALS Functional Rating Scale-revised (ALSFRS-R) progression rate from disease onset to baseline of <1.1 points/month. Here we assess long-term overall survival (OS) data of all participants from study AB10015 and test whether a signal in OS is evident in an enriched patient population similar to that prospectively defined for confirmatory study AB19001.

**Methods:** Survival status of all patients originally randomized in AB10015 was collected from participating investigational sites. Survival analysis (using the multivariate log-rank test and Cox proportional hazards model, with stratification factors as covariates) was performed on the intention-to-treat population and enriched subgroups, which were defined according to initial randomization, baseline ALSFRS-R progression rate and baseline disease severity.

**Results:** A significant survival benefit of 25 months ( $p=0.037$ ) and 47% reduced risk of death ( $p=0.025$ ) was observed for patients receiving 4.5 mg/kg/day masitinib ( $n=45$ ) versus placebo ( $n=62$ ) in an enriched cohort with  $\geq 2$  on each baseline ALSFRS-R individual component score (i.e. prior to any complete loss or severe impairment of functionality) and post-onset ALSFRS-R progression rate <1.1 (i.e. exclusion of very fast progressors) [median OS of 69 versus 44 months, respectively; hazard ratio, 0.53 [95% CI 0.31–0.92]]. This corresponds to the population enrolled in confirmatory phase III study, AB19001.

**Conclusions:** Analysis of long-term OS (75 months average follow-up from diagnosis) indicates that oral masitinib (4.5 mg/kg/day) could prolong survival by over 2 years as compared with placebo, provided that treatment starts prior to severe impairment of functionality. This trial was registered at [www.ClinicalTrials.gov](http://www.ClinicalTrials.gov) under identifier NCT02588677 [28 October 2015].

# Amyotrophic Lateral Sclerosis

Confirmatory phase 3 study is authorized by FDA and key European countries and actively enrolling patients

### Primary endpoint

- Change in the ALSFRS-R score at week 48

### Main secondary endpoints

- CAFS
- PFS
- Quality of life
- OS

### Main inclusion criteria:

- Disease duration  $\leq$  24 months
- Moderate ALS (Baseline functional score  $\geq$  2 on each ALSFRS-R items)
- Exclusion of slow progressors (less than a 1-point decline during run-in period), and fast progressors (more than a 4-point decline during run-in period).

### Randomization

- 450 moderate progressors
- Randomization 1:1:1
- 45 fast progressors included for exploratory analysis

### Extension at week 48

- In case of an individual positive benefit-risk assessed by the investigator.
- Study drug dispensation in extension will end 3 months before the last patient last visit of the main period

# Amyotrophic Lateral Sclerosis

There is a need for combination of treatments in ALS due to the multifactorial nature of the disease and Masitinib is the only drug with confirmatory trial having the same duration at week 48 as the first pivotal study

# Amyotrophic Lateral Sclerosis

## Masitinib has two pending regulatory decisions in ALS for conditional approval in Europe and Canada

- Notice of Compliance with conditions (NOC/c) filing accepted in April 2022
- Notice of Deficiency (NOD) issued in December 2022
- AB Science intends to respond to deficiencies within 90 days

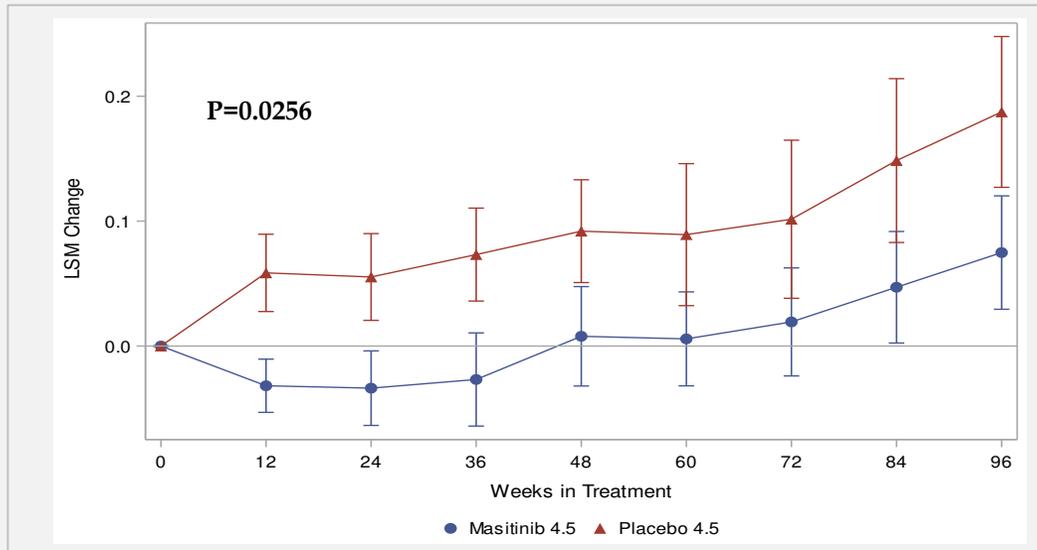

- Application filed in August 2022
- CHMP response expected in Q3 2023

# Multiple sclerosis

Phase 2B/3 demonstrated a significant benefit on disability progression with masitinib 4.5 mg/kg/day in patients with advanced stage of the disease

Significant reduction in progression on EDSS (Primary Endpoint\*)

Patients were enrolled at advanced disease stage

- Median age (years) : 50.0 (both masitinib and placebo)
- Median duration of first MS Symptom (yrs) : 12.4 masitinib and 12.2 placebo
- Median EDSS Score : 5.5 (both masitinib and placebo)
- % of patients with EDSS score of 6 : 49.0% masitinib and 47.5% placebo

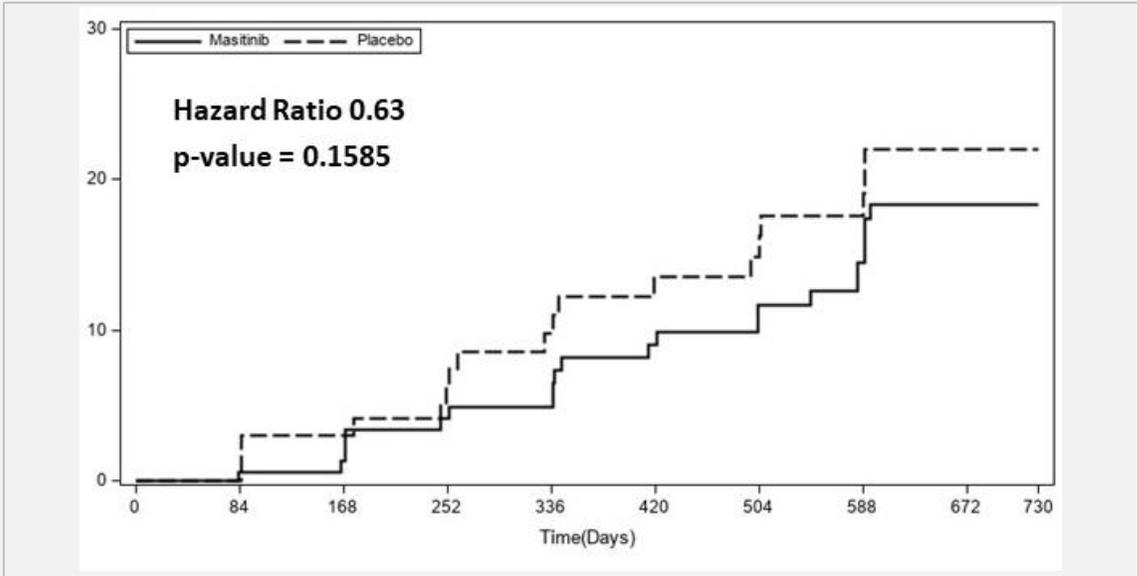

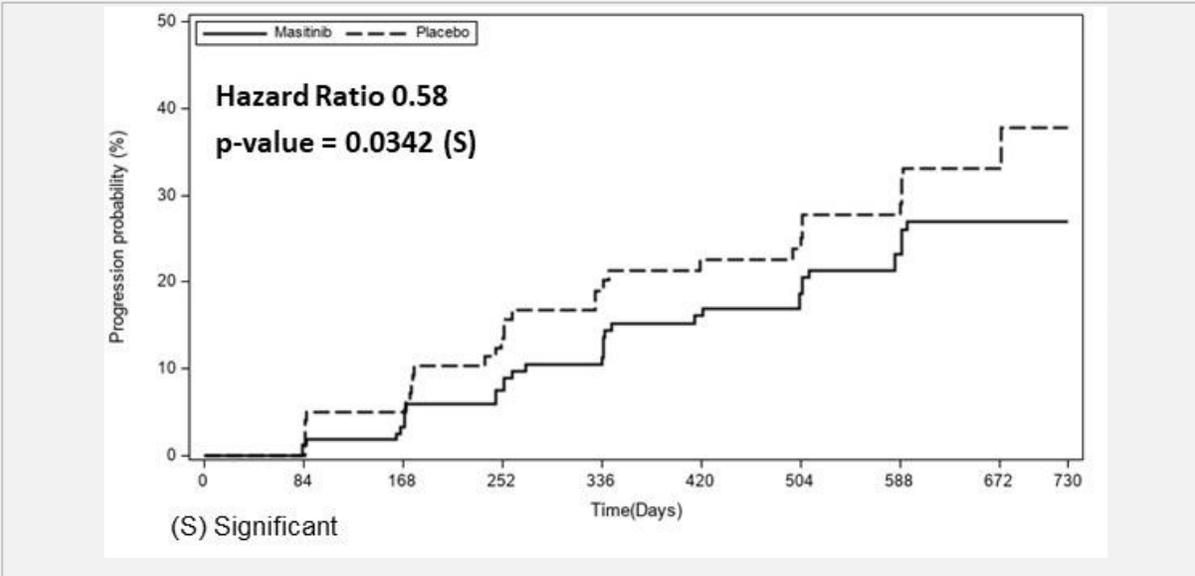

\* Change in EDSS

# Multiple sclerosis

Phase 2B/3 demonstrated a significant reduction of risk of first disability progression by 42% and a reduction of risk of confirmed (12-week) disability progression by 37%

**42% risk reduction of time to disability progression**

**37% risk reduction of time to confirmed disability progression**

# Multiple sclerosis

## Masitinib has the potential to become a best-in-class drug for PPMS and nSPMS

### Time to confirmed disability progression

Drug	Study Size (patients)	Type of Progressive MS	Hazard Ratio	Reduction in confirmed (3 months) disability progression
Masitinib 4.5 mg/kg/day	300	PPMS and nSPMS	0.63	37% (NS)
Ocrelizumab	732	PPMS	0.76	24% (S)
Siponimod	1,651	Active SPMS	0.79	21% (S)

S: Statistically Significant. NS : Not Statistically Significant

In masitinib study, time to confirmed disability progression was a secondary endpoint and the study was not powered to demonstrate significant effect on this endpoint

### Abstract

#### Background and Objectives

Masitinib is a selective tyrosine kinase inhibitor, targeting innate immune cells (mast cells and microglia) that are involved in the pathophysiology of progressive multiple sclerosis (MS). Study AB07002 assessed oral masitinib in patients with progressive MS who were progressing but not clinically active.

#### Methods

This randomized, double-blind, 2 parallel-group, placebo-controlled trial assessing 2 dose levels of masitinib vs equivalent placebo was conducted at 116 hospital clinics and specialized MS centers in 20 countries. Randomization (2:1) with minimization was performed centrally using an automated system. Patients, physicians, and outcome assessors remained masked to treatment group allocation. Patients with primary progressive MS (PPMS) or nonactive secondary progressive MS (nSPMS) without relapse for  $\geq 2$  years, aged 18–75 years, with baseline Expanded Disability Status Scale (EDSS) 2.0–6.0, and regardless of time from onset were treated for 96 weeks. The primary end point was overall EDSS change from baseline using repeated measures (generalized estimating equation, timeframe W12–W96, measured every 12 weeks), with positive values indicating increased clinical deterioration. Efficacy and safety were assessed in all randomly assigned and treated patients.

#### Results

A total of 611 patients were randomized; 301 in the masitinib 4.5 mg/kg/d parallel group and 310 in the uptitrated masitinib 6.0 mg/kg/d parallel group. Masitinib (4.5 mg/kg/d) ( $n = 199$ ) showed significant benefit over placebo ( $n = 101$ ) according to the primary end point, 0.001 vs 0.098, respectively, with a between-group difference of  $-0.097$  (97% CI  $-0.192$  to  $-0.002$ );  $p = 0.0256$ . Safety was consistent with masitinib's known profile (diarrhea, nausea, rash, and hematologic events), with no elevated risk of infection. Efficacy results from the independent uptitrated masitinib 6.0 mg/kg/d parallel group were inconclusive, and no new safety signal was observed.

# Multiple sclerosis

Confirmatory phase 3 study is authorized by FDA and key European countries and actively enrolling patients

## Primary endpoint

- Time to confirmed (12-week CDP) EDSS progression

## Main secondary endpoints

- 24-weeks CDP
- Change in EDSS from baseline considering all measurements from baseline up to Week 96
- Time to EDSS score of 7.0
- Brain MRI Assessments

## Main inclusion criteria:

- PPMS and nSPMS
- Onset of symptoms at least five years before inclusion
- No relapse diagnosed at least two years before inclusion (according to the 2017 revised McDonald's criteria)
- EDSS score of [3.0 to 6.0] inclusive
- Age 18 to 65 years old

## Randomization

- 800 patients
- Randomization 1:1

# Multiple Sclerosis

There is no approved drugs for non-active SPMS and only one for PPMS, and very few drugs into phase 3

Masitinib Positioning

Indications	Distribution of patients (Nbr EU + USA)	Approved treatments
Primary Progressive MS	15% (~ 150 000)	Ocrevus (Roche) approved in 2017
Non-active Secondary Progressive MS	35% (~ 350 000)	None
Active Secondary Progressive MS	10% (~ 90 000)	16 drugs since 1993
Relapsing Remitting MS	40% (~ 400 000)

**Abstract**  
**Background:** Masitinib is a small molecule drug targeting KIT, LYN, FYN and CSF-1R. Proof-of-concept that masitinib slowed cognitive decline in Alzheimer's disease (AD) was previously demonstrated [doi:10.1186/alzr175; doi:10.3233/JAD-200466]. Study AB09004 assessed oral masitinib administered as an add-on therapy to standard care for the treatment of mild to moderate AD.  
**Method:** Phase 2B/3 study AB09004 comprised two independent, double-blinded, placebo-controlled, sub-studies: masitinib at 4.5mg/kg/day versus placebo (randomized 1:1), and a titrated masitinib dose of 6.0 mg/kg/day versus matched placebo (randomized 2:1). Eligible patients that had a clinical diagnosis of AD with baseline minimal state examination (MMSE) score  $\geq 12$ – $\leq 25$ , and had received a stable dose of cholinesterase inhibitor (donepezil, rivastigmine or galantamine) and/or memantine for  $\geq 6$  months, were treated for 24 weeks. Primary endpoint was overall change from baseline at week-24 (analysis of covariance model) in the Alzheimer's Disease Assessment Scale-Cognitive Subscale (ADAS-Cog) or the Alzheimer's Disease Cooperative Study Activities of Daily Living (ADCS-ADL) score. The study was successful if a significant improvement was reached on either ADAS-Cog or ADCS-ADL at a 2.5% level of statistical significance, in either sub-study.  
**Result:** Masitinib (4.5mg/kg/day) (n=182, median (age=73 years, MMSE=19, ADCS-ADL=55.0, ADAS-Cog=25.5)) showed significant benefit over placebo (n=176, median (age=73 years, MMSE=19, ADCS-ADL=53.5, ADAS-Cog=24.8)) with a least-squares mean difference in ADAS-Cog from baseline ( $\delta$ Cog) of -1.46 versus 0.69, respectively, and corresponding least-squares mean difference between groups ( $\Delta$ Cog) of -2.15 (97.5%CI[-3.48, -0.81]); p=0.0003. All ADAS-Cog sensitivity analyses were convergent with the primary outcome, including the conservative jump-to-reference approach with  $\Delta$ Cog of -1.89 (95%CI[-3.06, -0.72]; p=0.0016). Considering ADCS-ADL,  $\delta$ ADL was 1.01 for masitinib (4.5mg/kg/day) versus -0.81 for placebo, with a  $\Delta$ ADL of 1.82 (97.5%CI[ 0.15, 3.79]); p=0.038. Safety was consistent with the known profile for masitinib. The proportion of patients presenting at least one adverse event (AE) or severe AE was respectively, 87.0% and 26.5% for masitinib (4.5mg/kg/day, n=185) versus 77.5% and 19.3% for placebo (pooled, n=280). Efficacy results from the titrated masitinib 6.0 mg/kg/day sub-study were inconclusive and no new safety signal was observed.

Alzheimer's Dement. 2021;17(Suppl. 9):e049866. <https://doi.org/10.1002/alz.049866> | wileyonlinelibrary.com/journal/alz | © 2021 the Alzheimer's Association | 1 of 2

# Alzheimer's disease

Confirmatory phase 3 study is authorized by FDA and key European countries and initiating patients enrolment

## Primary endpoint

- Change from baseline in ADCS-ADL score at week 24, and
- Change from baseline in ADAS-Cog 11 score at week 24

## Main secondary endpoints

- Time to severe dementia (MMSE < 10)
- Change from baseline in ADCS-ADL and ADAS-Cog score at week 48

### Main inclusion criteria:

- Patients with clinical diagnosis of Alzheimer's disease based on cognitive impairment and daily functional dependency at screening visit
- Patients with ADCS-ADL score at screening visit and baseline visit < 73
- Patients with MMSE  $\geq 14$  and  $\leq 25$  at screening visit and baseline visit

### Randomization

- 600 patients
- Randomization 1:1

### Extension at week 48

- In case of an individual positive benefit-risk assessed by the investigator

# Alzheimer's disease

Alzheimer's treatments are predominantly antibodies targeting amyloid plaques for the treatment of early Alzheimer's disease

Indications	Drug	MMSE (Severity) +  -	Reduction in clinical decline			Differentiating factors

# Mastocytosis

## Phase 3 demonstrated a significant reduction in symptoms with masitinib at 6.0 mg/kg/day

### 3.6 fold improvement in most prevalent symptoms

		Masitinib	Placebo	p-value	Odds ratio
Primary Analysis	4H75% pruritus, flushes, depression, asthenia	18.7%	7.4%	0.0076	3.63
Secondary Analysis	3H75% pruritus, flushes, depression	24.7%	9.8%	0.0071	3.06
	2H75% pruritus or flushes	27.2%	10.7%	0.038	2.63
	Pruritus 75% pruritus	22.0%	7.3%	0.032	3.13

### Improvement in objective markers of the disease

	Masitinib	Placebo	p-value
<b>Tryptase</b> - Patients with baseline tryptase $\geq 20$ $\mu\text{g/L}$	46	44	0.0001
<b>Average relative change from baseline</b> Mean $\pm$ SD	-18.0 $\pm$ 21.4	2.2 $\pm$ 26.9	
<b>Urticaria Pigmentosa (UP)</b> - Patients with baseline UP	33	36	0.0210
<b>Average relative change from baseline</b> in the Body Surface Area (BSA) covered by UP (Wallace correction)	-12.34 $\pm$ 26.41	15.91 $\pm$ 59.79	
<b>Darier's sign</b> – Number of patients (baseline)	37	37	0.0187
<b>Response rate for Darier's sign disappearance (Yes/No)</b> in patients with "Darier's sign" at baseline	18.92%	2.70%	

Cumulative response based on the generalized estimating equation model with missing data considered as failure. Longitudinal analysis with respect to symptoms as opposed to patient response rate at a single point in time. Response rates expressed as ratio of sum of actual responses between weeks 8 and 24 divided by the total number of possible responses over the same treatment period.

Response = 75% reduction from baseline in symptoms severity

4H75% = cumulative response in severe symptoms present at baseline among the four: pruritus, flushes, depression, asthenia.

3H75% = cumulative response in severe symptoms present at baseline among the three: pruritus, flushes, depression.

2H75% = cumulative response in severe symptoms present at baseline among the two: pruritus, flushes.

NOTE that in *Lancet* article these endpoints use the nomenclature 4R75% etc, R standing for 'response', a term preferred over 'Handicap'.

### Masitinib for treatment of severely symptomatic indolent systemic mastocytosis: a randomised, placebo-controlled, phase 3 study

Olivier Lortholary, Marie Olivia Chandesis, Cristina Bulai-Livideanu, Carle Paul, Gérard Guillet, Ewa Jassem, Marek Niedoszytko, Stéphane Barette, Srdan Verstovsek, Clive Grattan, Gandhi Damaj, Danielle Canioni, Sylvie Fraitag, Ludovic Lhermitte, Sophie Georjin Lavalie, Laurent Frenzel, Lawrence B Afrin, Katia Hanssens, Julie Agopian, Raphael Gaillard, Jean-Pierre Kinet, Christian Auclair, Colin Mansfield, Alain Moussy, Patrice Dubreuil, Olivier Hermine

#### Summary

**Background** Indolent systemic mastocytosis, including the subvariant of smouldering systemic mastocytosis, is a lifelong condition associated with reduced quality of life. Masitinib inhibits KIT and LYN kinases that are involved in indolent systemic mastocytosis pathogenesis. We aimed to assess safety and efficacy of masitinib versus placebo in severely symptomatic patients who were unresponsive to optimal symptomatic treatments.

**Methods** In this randomised, double-blind, placebo-controlled, phase 3 study, we enrolled adults (aged 18–75 years) with indolent or smouldering systemic mastocytosis, according to WHO classification or documented mastocytosis based on histological criteria, at 50 centres in 15 countries. We excluded patients with cutaneous or non-severe systemic mastocytosis after a protocol amendment. Patients were centrally randomised (1:1) to receive either oral masitinib (6 mg/kg per day over 24 weeks with possible extension) or matched placebo with minimisation according to severe symptoms. The primary endpoint was cumulative response ( $\geq 75\%$  improvement from baseline within weeks 8–24) in at least one severe baseline symptom from the following: pruritus score of 9 or more, eight or more flushes per week, Hamilton Rating Scale for Depression of 19 or more, or Fatigue Impact Scale of 75 or more. We assessed treatment effect using repeated measures methodology for rare diseases via the generalised estimating equation model in a modified intention-to-treat population, including all participants assigned to treatment minus those who withdrew due to a non-treatment-related cause. We assessed safety in all patients who received at least one dose of study drug. This trial is registered with ClinicalTrials.gov, number NCT00814073.

**Findings** Between Feb 19, 2009, and July 15, 2015, 135 patients were randomly assigned to masitinib (n=71) or placebo (n=64). By 24 weeks, masitinib was associated with a cumulative response of 18.7% in the primary endpoint (122.6 responses of 656.5 possible responses [weighted generalised estimating equation]) compared with 7.4% for placebo (48.9 of 656.5; difference 11.3%; odds ratio 3.6; 95% CI 1.2–10.8; p=0.0076). Frequent severe adverse events (>4% difference from placebo) were diarrhoea (eight [11%] of 70 in the masitinib group vs one [2%] of 63 in the placebo group), rash (four [6%] vs none), and asthenia (four [6%] vs one [2%]). The most frequent serious adverse events were diarrhoea (three patients [4%] vs one [2%]) and urticaria (two [3%] vs none), and no life-threatening toxicities occurred. One patient in the placebo group died (unrelated to study treatment).

**Interpretation** These study findings indicate that masitinib is an effective and well tolerated agent for the treatment of severely symptomatic indolent or smouldering systemic mastocytosis.

## AB8939 is a novel Microtubule-destabilizing drug able to cure mice with patient derived xenograft of Acute megakaryoblastic leukemia

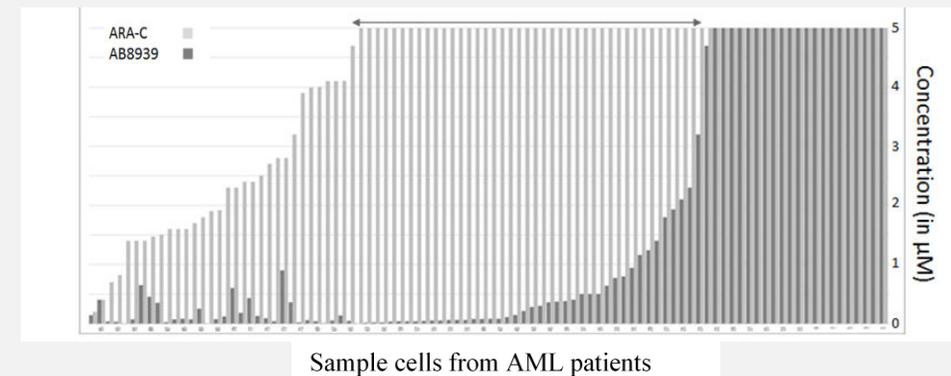

### Key Differentiating factors

- Overcomes P-glycoprotein (Pgp) and myeloperoxidase (MPO) mediated resistance
- Active in Ara-C resistant/refractory AML
- Activity seen across all AML subtypes
- Alone or combined with Ara-C, improved survival and reduced disease burden relative to Ara-C
- Active in azacitidine resistant AML, with greatly reduced hematotoxicity
- Drug profile support development of AB8939 as a treatment of relapsed/refractory AML patients unable to receive intensive chemotherapy

### Detection of AMKL26 PDX blasts in mice following single agent AB8939 treatment

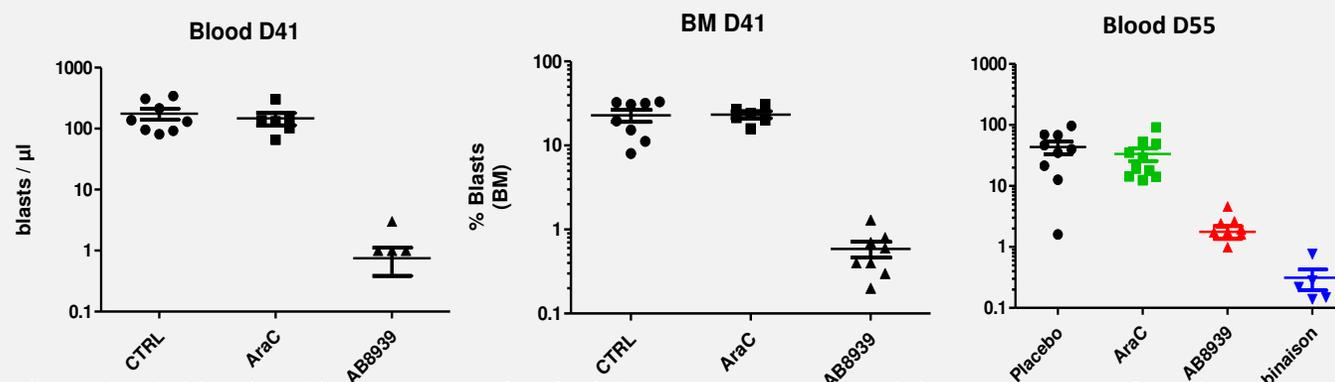

### Activity of AB8939 in Ara-C resistant/refractory AML patent blasts

In proliferation assays, 66% of Ara-C-resistant blasts were sensitive to AB8939 and overall 69% of blasts had nanomolar sensitivity ( $IC_{50} \leq 500$  nM)

### Activity in Ara-C resistant PDX model

Blasts detection in blood and bone marrow (BM) of the PDX#5 mouse model at D41 post graft and at D55 post graft

## Phase 1/2 in refractory Acute Myeloid Leukemia is authorized by FDA and key European countries and actively enrolling patients

### Phase 1/2 design

**Design:** Open-label, Uncontrolled, Multiple Doses, phase 1 study

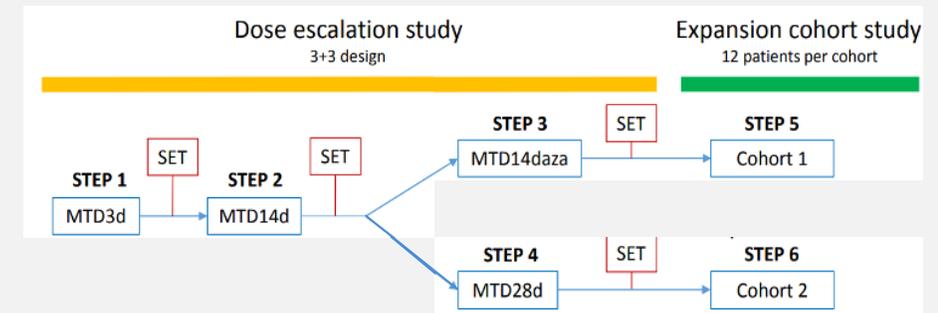

#### Main inclusion criteria:

- Patients with documented diagnosis of AML
- Patients in 2<sup>nd</sup> or 3<sup>rd</sup> line of treatment (if eligible in 1<sup>st</sup> line to high dose chemotherapy) OR in 2<sup>nd</sup> line of treatment (if not eligible to high dose chemotherapy)
- Patients with refractory myelodysplastic syndrome in 2<sup>nd</sup> or 3<sup>rd</sup> line of treatment
- Patients not eligible to hematopoietic stem cell transplantation (HSCT) at the time of inclusion

**Enrollment:** 72 patients

**Duration:** 3 days, 14 days, and 28 days

### Phase 1/2 Objectives

#### Phase 1 : Dose escalation

- Identify Maximum Tolerated Dose (MTD) at day 3, 14, and 28
- Identify Maximum Tolerated Dose (MTD) at day 14 in combination with azacitidine
- Determine the pharmacokinetics profile
- Recommend dose of expansion cohort

#### Phase 2 : Expansion cohort

- Determine early efficacy

## An investment bank has been mandated to seek potential licensing options for masitinib

### Scope

- Clinical development and/or commercialization of masitinib
- In one indication, or neurology, or all indications
- In one key country, or one region, or all countries

### Opportunity

- Advanced program in neurology
- Authorized by FDA and key European countries
- Rarity of late stage drugs belonging to small pharma
- Necessity to partner for commercialization
- Can speed-up clinical development

Potential discussions remain confidential
